to perform PCR on cells present in histochemical sections or cytochemical smears, e.g. for biological, forensic or pathological studies. The primer was one of a pair used to amplify papillomavirus DNA from human cervical cancer cells SiHa. A 449 bp PCR prod, was obtd, by this method whereas multiple primer pairs were needed for the same result using conventional PCR methods. See also AAQ34980-6. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cpds. N4-(1-4C alkyl) cytidine 5'-triphosphate (I) and N4-(1-4C alkyl)-2'-deoxycytidine 5'-triphosphate (II) are new. (I) and (II) serve as substrates for RNA and DNA polymerases for incorporation of the N4-(1-4C alkyl)-cytosine moiety into oligo- and polymucleotides. They can be used in DNA sequence analysis, primer extension reactions and nucleic acid amplification. To assess the potential for using N4-methyl-dCTP in PCR amplification, reaction mixts. contg. the canonical nucleotide set were compared to mixts in which dCTP was replaced by the N4- methyl-dytosine analogue, in a PCR experiment designed to amplify a 293 bp sequence of HPV16 DNA. Using a high-temp. regimen the desired fragment was obtained with the canonical dNTPs, but not with N4-methyl-dCTP. A low-temp. regimen, conducted with dCTP or with N4-methyl-dCTP A low-temp. mixt., cleanly produced identical amts. of the expected fragment as the sole amplification product. Arabidopsis thaliana.

W09525114-A1 21-SEP-1995.

Peptide transport gene atptr2a PCR primer.

31-JAN-1996 (first entry)

AAT05336;

ΗB

AAT05336 standard; cDNA; 20

ö

RESULT 1045

```
An upstream primer (AAT05336) starting at base 1975 of the Arabidopsis thaliana peptide transport atptr2a gene (see AAT05334) and a downstream primer (AAT05337) starting at base 2528 were used in RT-PCR to measure the extent of ATPTR2A transcription in plant tissue. A 569 bp fragment the atptr2a open reading frame is generated
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer for amplifying pigment epithelium-derived factor fragment

```
pigment epithelium-derived factor (PEDF) has both neuronotrophic and gliastatic activity, making it useful in cases where neurons die quickly and glia tend to proliferate (gliosis), e.g. in CNS cell culture, in neurodegenerative diseases and in CNS injury. The neuronotrophic effect of PEDF is especially useful for enhancing survival of neuronal cell cultures intended for use in transplantation. These include cultures of human foetal brain cells and neural retina and photoreceptor cells. The gliastatic activity of PEDF can be applied to inhibiting glial cell cused for inhibiting PEDF can be used for inhibiting PEDF activity or in an immunoassay for determining levels of PEDF in fluid, cellular or tissue samples e.g for determining ageing and/or other degenerative diseases. Eight primers (AAT11661-68) were synthesised base on the cDNA sequence of PEDF and used to amplify fragments of the PEDF gene for later sequencing. Two primers (AAT11661, AAT11662) were used to amplify a 2 kilobase fragment from exon 3 to exon

Example 5; Page 31; 69pp; English.

```
Neo-specific primer P8, (AAT78982), primer P586 (AAT78983) derived from exon 5 of the mouse Huntington's disease (HD) gene (see AAT78974), and primer P9 (AAT78984) derived from intron 5 of the gene were used in the genotype analysis of heterozygous transpenic mice embryos carrying a targeted mutation in exon 5. The results indicated that loss of function of the endogenous Hdh gene resulted in embryonic lethality during early post-implantation development. Transgenic mice can be used as models of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fas; antibody; human; immunoglobulin; variable region; rheumatism; autoimmune disease; rheumatoid arthritis; therapy; CDR; heavy chain; complementarity determining region; PCR primer; amplify; ss.

AAT47345-T47374 represent variants of a universal primer sequence (see AAT47344) derived from the bacteriophage vector Ml3mpl8. This sequence can be used as half of the DNA primer of the invention. The primers are used for amplification of a target DNA sequence, and can be used in a multiplex PCR amplification. The primers have the sequence 5'-XY-3', where X is a sequence that does not hybridise to the target sequence; such as this sequence. The melting temperature of a hybrid between X and its complement (in the absence of other sequences) is 60 degrees C. During early cycles of amplification, products are synthesised that contain the chimeric primers on either end. The primers then serve as high stringency recognition sequences for subsequent rounds of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 8; Page 10; 38pp; English.

ö protein This sequence represents a primer for the coding sequence for the protein of the invention is a recombinant protein (A), that comprises at least one region corresponding to an immunoglobulin (Ig) variable region which enables the protein to recognise and specifically bind to an antigen, preferably human Fas, and has substantially no more immunogenicity in a human parient than a human antibody. The proteins are useful for treating autoimmune diseases, and proteins are useful arthrits). (A) is based on a murine monoclonal antibody. As the protein lacks the constant region, it has substantially no more immunogenicity in the human patient than a human publication of the protein lacks the constant region, it has substantially no more immunogenicity in the human patient than a human publication. This antisense oligonuclectide is specifically hybridisable with selected DNA or RNA deriving from the puromycin-sensitive aminopeptidase (PSA)-99. This oligonuclectide is used for dignosing conditions associated with PSA expression. The human PSA-99 (875 amino acids) and the murine PSA-99 (970 amino acids) both exhibit PSA activity and can be used to generate anti-PSA artibodies. Cell lines which produce the antibody and host cells transfected with vector containing nucleic acid molecules encoding the PSA and the oligonuclectides can be used in assays for identification of agents which act by targeting PSA, for modulating PSA activity or agents which act by targeting PSA, for modulating PSA activity of endogenous PSA substrates, proliferation rate or viability of cells or induce apoptosis within cells by inhibiting PSA activity. Agents which including the psa activity in cells with modulation of the amount of PSA in cells due to modulation of PSA synthesis, may be used in treatment of proliferative diseases, including tumours such as leukaemias and
                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated protein with puromycin-sensitive aminopeptidase activity - which may be used in treatment of proliferative disorders, including cancer and
                                                                                                                             ĕ
  amplification. As a result, the annealing efficiency of different primers
                  and their targets in a multiplex amplification reaction is normalised, thereby reducing preferential amplification of certain targets. The chimeric primer comprises a 5' universal domain and a 3' target-specific domain. They are used for the simultaneous PCR amplification of multiple DNA targets in a sample. The primer containing AAT47344 is particularly useful in high-throughput genetic screening for detecting the presence of multiple defined targets e.g. to detect mutations in genes like the cystic fibrosis transmembrane conductance regulator (CPTR), the Wilms Tumour, and the beta-thalassaemia genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             psoriasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences shown in AAV33257 to AAV33263 represent primers used for the PCR amplification of the human papillomavirus (HPV) type 16 genome contained in the human certical cancer cell line SiHa. The invention provides a thermal cycler sample compartment optimised for holding and controlling he temperature of one or more microscopes which facilitates thermal cycling. It also contains a device (Barrier) for protecting a microscope slide from fluid or vapour when the slide is sealed in the device, comprising a plastics material that has high thermal in the conductivity, and is impervious to fluid or vapour, and is dimensioned so as to receive the slide. The new thermal cycling compartment is useful for performing in situ PCR for detection of target nucleic acid sequences directly from cells fixed onto a microscope slide, used in the field of cell biology, forensic science and clinical, veterinary and plant pathology. The modified heat blocks increase the speed and reliability of in situ PCR performed on microscope slides by accelerating and rendering more uniform the heat transfer which occurs during thermal cycling.
                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New thermal cycler for in-situ PCR on microscope slides - and device for protecting microscope slides from fluid or vapour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes LRP5 (low density lipoprotein (LDL) receptor related protein, previously designated LRP-3). Nucleic acid molecules (NAMS) encoding LRP5 can be used for determining if an individual is susceptible to insulin dependent diabetes mellitus (IDDM). The NAMS or proteins can be used for reducing triglyceride levels in the serum of an individual. Therapies that affect LRP5 may also be useful in the treatment of autoimmune diseases such as glomenionephritis, diseases and disorders involving disruption of endocytosis and/or antigen presentation, cytokine clearance and/or inflammation, viral infection, pathogenic bacterial toxin contemination, elevation of free faity acids or hypercholesterolemia, type 2 diabetes, osteoporosis, Alzheimer's diseases and cardiovascular disease. Products from the present invention can also be used for detection, diagnosis and drug screening. AAV889917 to AAV86012 represent PCR primers for obtaining LRP-3 cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LRP5; LDL-receptor related protein; LRP-3; IDDM; diagnosis; endocytosis; insulin dependent diabetes mellitus; autoimmune disease; glomerulonephritis; inflammation; viral infection; osteoporosis; hypercholesterolemia; Alzheimer's disease; low density lipoprotein; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated LDL-receptor related protein - used to develop products for treating, e.g. elevated triglyceride levels, diabetes, autoimmune disorders, inflammation or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The primers AAV43732-V43776 were to produce cancer associated gene fragments which can be used to detect cancer cells in tissue samples or biological fluids. They are detected by monitoring the change in mRNA expression as compared to normal tissue of one or more cancer-associated genes whose cDNA stringently hybridises to the nucleic acid fragments. The change in expression may be an increase or a decrease compared to normal lissue. The mRNA expression may be determined by PCR, Northern blotting or ribonuclease protection assay, or by determining the change in the amount of protein encoded by the gene(s) as compared to normal tissue, for example by using a labelled antibody recognising the protein. Detection of cancer cells for cancer diagnosis, including detection of metastatic cancer cells in tissues other than the primary tumour site
                                                                                                                                                                                                                                                                                                                                                                                                Detection of cancer cells in tissue samples - by changes in mRNA expression compared to normal tissue of specific cancer-associated gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gарв

Sequences shown in AAV54677 to AAV54683 represent primers used for the PCR amplification of the Human papillomavirus (HPV) gene contained in the human cervical cancer cell line SiHa. These are used in the course of the invention which provides a thermal cycling device comprising a ceramic sample plate supporting a ceramic sample plate supporting a flat thermally coupled to the plate ample and a thermal sensor, a heater thermally coupled to the plate ample and a colorer for the substrate. The device atther maintains the temperature of the sample or subjects it to thermal cycling. The thin ceramic plate permits very rapid heat transfer to a sample on a microscope slide and this thermal cycling devise can be used for PCR amplification or hybridisation of target nucleic acid on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 2 A; 4 C; 6 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human c-jun protein antisense oligonucleotide #9.
```

```
New nucleic acid encoding human cyclin-dependent kinase-10 - used e.g. to identify modulators of cell cycle progression for treating cancer or immune cell proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a vector for plant transformation, comprising a TT-DNA with flanking T-DNA boxders and also a polynucleotide that prevents the development of plant transformants containing more vector sequences than the T-DNA sequence. The vectors encode toxins that are specific to
                                                                                                                                                                                                                                                           Gene-specific primer PK22L234 and adapter primer AP1 (see AAV32935) were used in a RACE PCR technique for cloning a 5' coding region of novel human cyclin-dependent kinase 10 (CDK10) cDNA, using adapter-ligated human placenta cDNA as template. Nested primers (see AAV32936-37) were used in a second PCR, to produce an approximately 600 bp product. A 3' fragment was identified by database search, and a full-length sequence (see AAV32932) was produced in vector pLITMUGSB:CDK10. The CDK10 protein product (see AAW49083) is used e.g. to identify modulators of cell cycle progression and for treating cancer or immune cell proliferation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New vector for plant transformation - useful for producing toxins that are specific to certain plants, or those which act on membrane systems and/or other cellular structures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plant transformation, T-DNA, toxin, transgenic; transgenic food;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAV69978 to AAV69988 represent antisense oligonuclectides which are specifically hybridiaable with a region of a nucleic acid encoding human c-Jun protein. The antisense compound regulates the expression of the coligonuclectides which regulate the c-Fos protein. The antisense oligonuclectides which regulate the c-Fos protein. The antisense oligonuclectides are used for the diagnosis and treatment of diseases or disorders associated with Activating Protein lexpression, of which compositions as c-Fos and/or c-Jun together with a carrier and a chemotherapeutic agent. They are used to regulate the expression of c-Fos or c-Jun in cells or tissues, preferably by inhibiting metastasis. They also regulate cell cycle expression and can be used to regulate cell cycle expression and can be used to treat an animal with, or being prone to, a hyperproliferative disease
                                                                                                                                                                                                                                                                                                                                                                         Antisense oligonucleotides regulating Activating Protein 1 subunits - hybridise with c-fos and c-jun mRNA, used for regulating metastasis, cell cycle expression and hyperproliferative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

             cellular structures. Examples of genes include those encoding ribozymes against endogenous RNA transcripts, proteins evoking hypersensitive reactions, and RNA transcripts used for antisense/or suppression inhibition of gene expression. The polymucleotide sequence contained the vectors prevents the transfer of DNA sequences beyond the T-DNA transgenic This avoids contamination of transgenic plants and/ or transgenic food with vector DNA. Sequences AAXO5690-91 represent primers used for the PCR amplification of the barnase open reading frame. This is used in the construction of a barnase expression cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides HIV cofactor inhibitors that contain oligonucleotides with a base sequence complementary to the CXCR4 or CCR5 genes. Such inhibitors can be formulated into drug compositions for prevention or treatment of HIV infection, with inhibition of expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 of CXCR4 or/and CCR5 gene. Sequences AAZ31244-306 represent antisense oligonuclectides to the CCR5 gene
                                                                                                                                                                                                                                                               Gaps
certain plants, or those which act on membrane systems and /or other

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PCR primers AA201426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AA201455). These ORFs accode polygeptides (see AAX36754-373949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epridmitis, cervicitis, alpinglis, perihapatitis, bartholinitis, penumbathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these

These ORFs encode polypeptides (see AAY36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases uch as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and veneral lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivities, genital disease, perihepatitie, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, se.

                                                                                                                                                                                                                             PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs accode polygeptides (see AAZ075734-273794) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases and as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis, genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingtis, perinepatitis, bartholinitis; pheumopathy in breast feeding infants; and venereal lymphogranulomatosis.

This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonucleotide, which is the reverse complement of part of a unique target which is the reverse complement of part of a unique target oligonucleotides present in a mixture of target deletion sequence oligonucleotides. The compositions form a method for characterizing a sample of target deletion oligonucleotides which are labelled and hybridize with the probe oligonucleotides which are labelled and oligonucleotides and their targets are represented in AAX2348-X3709. Oligonucleotides and their targets are represented in AAX2348-X3709. Oligonucleotides and their targets are represented in AAX2348-X3709. Oligonucleotides characterized by the method form pharmaceutical compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human immunodeficiency virus (HIV), or a non-human retrovirus, including infilenza virus, Epstein Barr virus, Respiratory Syncytial Virus or cytomegalovirus (CMV). The compositions enable characterization of deletion sequences, and quantification of different specificity of the oligonucleotides having related, also, if the specificity of the oligonucleotides and may be performed using the reverse complement is not modified, the method may be performed using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
oligonucleotides - useful for characterizing a sample of target deletion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0.8%; Score 13.8; DB 1; Length 20;

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX1990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent critis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX34584- AAX35879) can be used nucleotides sequences can also be used as immunogenic compositions as vaccines. Vectors containing C. pneumoniae especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a DNA molecule comprising a sequence of characteristic senceding an alphalF-subunit of a mammalian retinal calcium channel (RCC), including a human and antice, a mammalian retinal calcium subunit and orthologs of the human and murine alphalF-subunit, a murine alphalF-subunit and orthologs of the human and murine alphalF-subunits. The RCC gene may be used to develop products for diagnostic tests, for incomplete CSMB and risk assessment in affected families. The RCC gene can provide information as to the basic defect in this retinal conditions, which could lead to effective methods for treatment or cure of the disorder. As the associated features of myopia, nystagmus and strabismus frequently observed in patients with incomplete CSNB may be caused by calciumtogulated development pathways, identification of the RCC gene may help to elucidate the molecular details of eye development and which may lead to treatment for related eye disorders or diseases. AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment.

N.B. The SEQ ID NOS 2852, 2913, 2974, 3035, 3056, 3157, 327, 3297 and 3357, are not actually given a sequence in the Sequence Listing from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel biallelic markers used to construct a high density disequilibrium

The invention relates to novel serine proteases designated BSSP6

(AABI1712-B11714), and to nucleic acids encoding them (AAA61763-A61765).

The invention also relates to vectors and transformants comprising BSSP6

nucleic acids; transgenic animals in which the expression level of BSSP6

can be varied; and an mBSSP6 knockout mouse. The invention additionally

encompasses anti-BSSP6 antichodies and methods of production of such

antibodies, methods of BSSP6 detection using the antibodies, and the use

of BSSP6 proteins or fragments as diagnostic markers for certain medical

conditions. Nucleotides encoding BSSP6 were initially isolated in a human

brain cDNA library using degenerate PCR primers (AAA6795-A61796) based

on conserved regions of serine proceases. The BSSP6 serine proteases and

nucleotides encoding them are useful in detecting homologues, mutants and

prostate gland, placenta, testis and spleen) as diagnostic markers for

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

prostate pland, placenta, testis and spleen) as diagnostic markers for

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

prostate pland, placenta, testis and spleen) as diagnostic markers for

conditions such as Alzheimer's disease, epilepsy, cancer, inflammation,

primers AAA61775-A61784 and AAA61795, while primers AAA61765-A61796

AG1792 were used to isolate and annulify mutine BSSP6 cDNA (AAA61764).

Primers AAA61768-A61774 were used to construct plasmids used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Serine protease BSSP6, useful in detecting homologs, mutants and polymorphic variants as markers for diagnosis of Alzheimer's disease, epilepsy, cancer, inflammation, infertility and prostate hypertrophy, using blood or other tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      per primers AAX89470-X89471 are used to screen a BAC library for the presence of a 14-3-3 sigma nuclectide sequence. 14-3-3 sigma is a member of the 14-3-3 protein family and is also known as HMS1 or stratifin. 14-3-3 sigma expression is regulated by p53 and exogenous expression of 14-3-3 sigma results in G2 block. The 14-3-3 sigma nuclectide and amino acid sequences are used in the invention to develop agents for the diagnosis, susceptibility determination and treatment of cancer. The amino acid sequence can be used in method for suppressing the growth of tumour cells. The 14-3-3 sigma polypeptides can mediate cell cycle arrest upon damage to cellular DNA. 14-3-3 sigma probes can be used for diagnosing, testing cancers. They can also be used to treat other proliferative diseases, e.g. psoriasis, polype, warts, and inflammatory diseases. The contract of the proposition of the contraction of the contracting the contraction of the contraction of the contraction of the c

The present invention describes an antisense compound (I) of 8-30 nucleobases, specifically hybridising to, and inhibiting expression of, human jun N-terminal kinase kinase-2 (JKK-2). Also described is a method of inhibiting the expression of human JKK-2 in human cells or tissues, comprising contacting the cells or tissues, with (I), in vitro. (I) has suitinflammatory, cytostatic and antiinfectious activities. (I) is useful for inhibiting the expression of JKK-2 in human cells or tissues and prevents or delays infection, inflammation or tumour formation associated with altered expression of JKK-2 in human is also useful for detecting the levels of JKK-2 in a sample. The present sequence represents a phosphorothioate antisense oligonucleotide for human JKK-2, from the

```
The invention relates to 12 novel genomic DNA sequences and proteins which are components of the omega hydroxylase complex of Candida tropicalis ATCC 20366. The DNA sequences (AAA30566-A3057) respectively encode cytochrome P450 NADPH oxidoreductases CPRA and CPRB (AAY90596, AAY90597) and cytochrome P450 monooxygenases CPRA and CPRB (AAX90596, CYP52A2A). CYP52A2A, CYP52A2A, CYP52A2A, CYP52A3B, CYP5A3B, CYP5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   fluids, agricultural chemicals, pharmaceuticals, dyes, surfactants, adhesives and fragrances. The CPR and CYR nucleic acids and proteins enable inexpensive large scale production of industrially useful dicarboxylic acids. Sequences AAAAJS22-AD3543 represent QC-RT-PCR primers used in an exemplification of the invention to amplify the Candida tropicalis ATCC20366 CPR, CYP and beta-oxidation POX gene target mRNA.

Anti-human Fas humanizing antibody-containing antirheumatic agents.

Disclosure; Page 16; 109pp; Japanese.

```
The present invention relates to antirheumatic agents which comprise as active ingredients an immunoglobulin M (IgM) protein. The IgM protein does not include a J segment, has apoptosis inducing activity, and consists of a light and heavy chain polypeptide produced synthetically. The agents of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially rheumatism. The IgM molecule used in the invention has human Fas-antigen binding properties. Included in the invention are nucleotide sequences of the invention are nucleotide sequences of corresponding protein sequences (see AAB12913-B12918 and AAB12919), and nucleotide sequences of the humanised anti-human Fas Ig CH11 (see AAB1201-A7802) and the corresponding protein sequences (see AAB12913-B12918), and nucleotide are anti-human Fas antibody CD peptides (AAB12902-B12907). Primers specific for the anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78317-A78318 and AAA78335-A78337, while humanised anti-hum an Ig DNA used in the invention are represented by sequences AAA78377-A78318 and AAA78335-A78337, while humanised anti-Pas Ig DNA sequencing primers are represented by sequences AAA78331-A78333 and AAA78337. Primer represented by sequences AAA78331. And AAA78337. Primer sequences AAA78327-A78333 and AAA78337. Primer represented by sequences AAA78331-A78334 and AAA78337. Primer represented by sequences AAA78327-A78334 and AAA78337. Primer represented by sequences AAA78337. Primer represented by sequences AAA78337. Primer represented by sequences AAA78337. Primer represented by a Bacific for murine Ig DNA, and are used in

The invention relates the identification or genes whose expression levels ethanol, stimulants, opiates). The methods of the invention monitor the response of a cell to a drug of abuse, and comprise contacting the cell with the drug of abuse, and comprise contacting the cell with the drug of abuse, and detecting the expression of one or more of the test of a cell to a drug of abuse, and comprise contacting the cell with the drug of abuse, and detecting the expression of one or more of genes whose expression levels are altered by chronic or acute exposure to one or more drugs of abuse. The identification provides a valuable tool to evaluate the response to one or more drugs of abuse. By altered in alcohol tolerance and/or addiction provides a valuable tool to evaluate the response provides information useful in designing to evaluate the response provides information useful in designing to evaluate the response provides information useful in designing to evaluate the response provides information useful in designing to evaluate and recovery regimens, and in evaluating the susceptibility of an organism or patient to drugs of abuse. Sequences AAZ59941-Z59951 response of the organism to drugs of abuse. Sequences AAZ59951 represent reverse transcriptase-PCR (RT-PCR) primers used to amplify 4 con a contact or contact or modification of the present invention. The genes whose expression was analysed were used in Northern blot analysis of genes whose expression analysed were dopamine beta-hydroxylase (DBH) and sodium dependent or expense to exemplification of the present invention. The genes whose expression and recompanism the deta-hydroxylase (DBH) and sodium dependent to morepinephrine metabolism; delta-like protein (DLK); and monocyte chemoattractant peptide 1 (MCP-1). These genes are thought to be important targets of ethanol. Primers AAZ5944-Z5945 were used to important targets of ethanol. Primers AAZ5944-Z5945 were used to
The invention relates the identification of genes whose expression levels

The present invention describes an isolated nucleic acid (I) encoding a mammalian Lhx3. (I) is used in assays to: (I) detect and quantify the presence and level of expression of Lhx3, Lhx3a or Lhx3b, in a sample; (2) identify a compound that affects expression, the level of expression, or the activity of Lhx3, Lhx3a, or Lhx3b in a cell; (3) identify a compound that affects binding or Lhx3 bin a cell; (3) identify a bund of a pituitary trophic hormone gene promoter; (4) identify a human afflicted with a disease, disorder, or condition caused by altered and (S) detect a mutation in a Lhx3 allele in a human. The coding region of human Lhx3 has been genomically mapped to the subtelomeric region of human Lhx3 has been genomically mapped to the subtelomeric region of human Lhx3 is also known as P-LIM or LIM-3. The present sequence represents a PCR primer used in the amplification of human Lhx3, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid encoding mammalian Lhx3 for identifying a buith a disease, disorder, or condition caused by an altered level of expression or binding of Lhx3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Dog; genome; genomic marker; radiation hybrid map; identification; chromosome location; gene marker; polymorphic microsatellite marker;

                                                                                                                                                                                                                                                                                                               The present invention describes a radiation hybrid map of the dog (Canine familiaris) genome comprising the genome location of a marker selected from AAA66139 to AAA66942. The radiation hybrid map is useful for identifying and localising dog genes, since it covers approximately 80 % of the dog genome and provides a dense map integrating different types of the dog genome and provides a dense map integrating different types (i.e. Type I and Type II) of markers. The map and the dog genome markers for complementary sequences) are especially useful to identify genes responsible for phenotypic and behavioural traits in dogs, to identify morbid genes to analyse diseases and identify implicated genes in such diseases and their alleles, and to study dog pedigrees. They may also be unvolved in genetic diseases
                                                                                                                                                                                                                                    New radiation hybrid map of the dog, Canine familiaris, genome, useful for e.g. identifying genes implicated in phenotypic and behavioral traits or in genetic diseases and for studying dog pedigrees.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; full length cDNA; cDNA synthesis; oligo-capping; PCR primer; ss

830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.
                                                                                                                                                                                                                                          clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a primer used to amplify a human cDNA clone provided in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel transport system (A) for molecular substances (I) containing recombinantly prepared subunits (SU) based on amino acids (as) comprising: (i) at least two modified SU with one difference, and/or (ii) one or more modified SU with at least two
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Transport system for compounds, useful e.g. in gene therapy, comprises mosaic-like assembly of different protein subunits able to encapsulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Transport system; gene therapy; infection; tumor; ss; LLO; PCR primer; human immune deficiency virus; hemophilia; muscular dystrophy; capsid; cystic fibrosis; virus-like particle; cell targeting; listeriolysin O.

combined in a mosaic feashon to form (A) in which (I) can be encapsulated. (A) Are used to deliver (I) specifically to cells, particularly DNA to eukaryotic cells for gene therapy, e.g. of infections by human immune deficiency virus, tumors and a wide range of inherited diseases such as hemophilia, muscular dystrophy or cystic fibrosis. Capsids or other virus-like particles can be assembled, simply and in modular feathon, in vitro, allowing control over stoichiometric composition. SU can be modified to impart a wide variety of selected immunogenicity. (A) do not require extensive testing to ensure that they are safe (contrast replication-deficient viruses), also SU can be prepared in very pure form and are easily labeled fluorescently (for quality control or localization). This sequence represents a PCR primer used in the production of a Listeria monocytogenes listeriolysin LO variant which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Macrophage migration inhibitory factor; WMIF; antisense; neurological; hyperproliferation; nootropic; antihormonal; immunosuppresive; human; antiinflammatory; cytostatic; ss.
differences; and (iii) (optionally) unmodified SU. The various SU are

1547 GCCTTCGGTCTTCGTCG 1563 Matches δ The invention relates to antisense oligonucleotides 8-30 nucleotides in inhibitory factor (MMIF), where the antisense compound specifically hybridizes with and inhibitors he expression of MMIF. The antisense nucleotides with and inhibits the expression of MMIF. The antisense nucleotides are useful for the treatment of a disease or condition associated with MMIF such as neurological, hormonal, immune, inflammatory or hyperproliferative disorder. Sequences AAH2191-268 represent chimeric antisense phosphorothicate oligonucleotides used for inhibition of human MMIF mRNA expression New antisense compound(s) are useful to inhibit a nucleic acid molecule encoding macrophage migration inhibitory factor. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno ersponse. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-tich) or thymidime (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or corthomyvaviridae), bacterial antigens (e.g. toxoplasma, and/or corthomyvaviridae), bacterial antigens (e.g. toxoplasma, heemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the

This invention describes novel regulatory sequences (A) derived from human fascin that provide specific expression in dendritic cells (DC) and which have antiviral, antibacterial, antibacterial, antiparasitic, anti-
antiparasitic, anti-
antiparasitic, anti-
antiparasitic, anti-
antiparasitic, anti-
antiparasitic, anti-
and poptocic activity. (A) are
sequences etc. in DC-specific fashion. Recombinant DNA, vectors and host
cells that contain (A) are useful: (1) in vaccines against viruses,
bacteria, fungi, parasites, tumors, allergens and plaques in Creutzfeld-
antergies, infections, autoimmune diseases and transplant rejection. They
can also be provide specific expression of antigens and immunoregulators
in DC. for isolation and identification of call factors and cis-elements
from regulatory sequences that mediate DC-specific expression, to
determine the degree of maturity of DC and to block transcription
factors, by providing binding sites in DC. (A) provide DC-specific
expression of nucleic acid under their control, allowing a more specific
regulation of the immune response and eliminating the long and laborious
transformed), including transformation in vitro. This sequence represents
a primer associated with the human fascin gene described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New regulatory sequences from the fascin gene, useful for providing dendritic cell-specific expression of e.g. antigens, e.g. for vaccination against tumors and infections.
                                                                                                                                                                                          Fascin; regulatory sequence; human; dendritic cell; antiviral; tumor; antibacterial antifungal; antiparasitic; anti-allergic; neurological; immunomodulatory; apoptortic; expression regulator; vaccine; allergen; Creutzfeld-Jakob disease; Alzhelmer's disease; gene therapy; autoimmune disease; transplant rejection; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 2 A; 4 C; 9 G; 5 T; 0 U; 0 Other;

The present invention relates to a retrovirus of type C morphology, which sediments in a sucrose gradient at a density of 1.16-1.18 g/l. The retrovirus is infectious for canine cells and belongs to the oncovirinae group. The present sequence is a PCR primer for the retrovirus of the present invention. The retrovirus can be included in pharmaceutical compositions or medicaments to treat autoimmune diseases, haematopoietic malignant tumours, especially in humans. The retrovirus can also be used in gene therapy to introduce a transgene into an animal,

The invention provides an agent comprising a pyrone compound or dihydroxy compound of specified formulae given in the specification. The agent is used for correcting gene expression regulation errors. Errors in the following genes may be corrected: Li-6, Li-10, hemeoxygenase-1, prostaglandin G/H synthase-2, macrophage inflammatory protein-1-alpha, IL-7 receptor, macrophage inflammatory protein-1-beta, liver and activation-regulated chemokine, macrophage inflammatory protein-2-beta, macrophage inflammatory protein-1-beta, macrophage inflammatory protein-1-beta, macrophage inflammatory protein-1-beta, macrophage inflammatory protein-1, marrix metalloproteinase-9, migration inhibitory factor-related protein-1, matrix metalloproteinase-9, migration inhibitory factor-related protein-1, ranskerolase, adenosine AZa receptor, CD7 artigen properdin P factor, regulator of G-protein signaling-2, Nef-associated factor-1, myeloid leukemia cell differentiation protein-1, signal peptidase complex, and also side-effects caused by them such as inflammation. Sequences AAH76220 7620 represent PCR primers used in the course of the invention

PCR primers AAF80165-66 were used to amplify the left-hand GAL7 promoter. The amplified sequence was used to express fusion proteins comprising a heavy chain variable region of an antibody isolated from llama, which was immunised with Malassezia furfur. M. furfur has been implicated in active agent, and used to produce a composition is conjugated to an active agent, and used to produce a composition for topical application, e.g. to the scalp. The topical composition, e.g. hair care products such as shampoos and conditioners, skin care lotions, shower gels, etc., is useful for targeting an active agent to a site at which M. furfur is present for the treatment and prevention of dandruff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition for use in targeting active agent, especially antimicrobial agent to scalp for treating, preventing dandruff, has active agent conjugated to antibody capable of binding specifically to Malassezia

The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha, see AAF57718 for the reference asquence). Polymorlectides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a PCR primer for human IL4R-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode. The mucleic acids and proteins may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids (or vectors) and proteins may be used to treat disorders
                                              New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human, Gene 216; chromosome 20p13-p12; antiasthmatic; anorectic; antiinflammatory; gastrointestinal; gene therapy; vaccine; asthma; obesity; inflammatory bowel disease; primer; ss.

cc associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing canderive proteins or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in the nucleic acids and complementary sequences may also be used as DNA probes in need of sequences in samples and therefore which patients may be in need of sequences in samples and therefore which patients may be in need of restorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies and attagonists may also be used as diagnostic antibodies and attagonists may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic and activity. The anti-Gene 216 antibodies may also be used as diagnostic capents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or ELISA). Disorders that may be consented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present convention. The primares are used in the physical mapping of the cinvention. The primares are used in the physical mapping of the gene (assay) or ELISA). Disorders that may be conformational polymorphism identification using single strand conformational polymorphism and genotyping (ABZ72017-ABZ72185-ABZ72268) and genotyping (ABZ72117-ABZ72181).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated genes (Gene 216) from human chromosome 20p13-p12 and the proteins they encode, useful for the prevention, diagnosis and treatment of asthma, obesity and inflammatory bowel disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated genes (Gene 216) from human chromosome
20p13-p12 and the proteins they encode. The nucleic acids and proteins

may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate Gene 216 expression. For example, the nucleic acids of or vectors) and proteins may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of gene 216 by expressing inactive proteins or to supplement the patients own production of Gene 216 proteins. Additionally, the nucleic acids may be used to produce the secreted Gene 216 protein, by inserting the nucleic acids into a host complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid complementary sequences and therefore which patients may be in need of restorative therapy. The Gene 216 protein may also be used as antigens in the production of antibodies and activity. The anti-Gene 216 and in assays to identify and activity. The anti-Gene 216 and in assays to identify and activity. The anti-Gene 216 antibodies may also be used as diagnostic agents for detecting the presence of Gene 216 proteins in samples (e.g. by enzyme linked immunosorbant assay or EursA). Disorders that may be prevented, diagnosed and/or treated by the above methods include, for example asthma, obesity and inflammatory bowel disease. The present sequence is that of a Gene 216 traited primer used in examples of the invention. The primers are used in the physical mapping of the gene inventional polymorphism identification using single strand conformational polymorphism identification using single strand conformational polymorphism identification using single strand conformational polymorphism and genotyping (ABZ722194).

their ability to modify the binding of G-protein coupled receptor (GPCR) protein ZAQ and related proteins (human ZAQC, human ZAQT, rat ZAQI (TZAQI), TZAQZ, human and mouse ISE (MISE) receptor, and mouse GPR73) to their ligands (the mature form of human, mouse or rat Bv8 protein). The receptor protein and ligand are contacted in the presence or absence of the test compound. The compounds are useful in a drug composition for the treatment, and prevention of dispertive and central nervous system (CNS) disorders, including bowel inflammation, diarrhoea, constipation, food absorption disorders, Alzheimer's disease, Parkinson's disease and semination of the present sequence represents a PCR primer used in the Screening of compounds modifying the binding of G-protein coupled receptor protein ZAQ and related proteins to their ligands for use in treatment and diagnosis of digestive disorders. present invention relates to a screening method for compounds for Example 5; Page 127; 197pp; Japanese. examples of the present invention

Microscopic slide temperature control apparatus for medical diagnosis comprises coupling resistive heating element between the connection pads provided at opposing ends of slide.

Example 3; Col 27; 25pp; English.

The sequence represents PCR primer PV3. The primer was used in the invention to amplify DNA from cells of the stable human cervical cancer cell line SiHa, containing on integrated copy of human papilloma virus (HPV) type 16 ppr human genome. The invention relates to a novel thermal cycling device for regulating the temperature of a biological sample on flat substrate. The invention also includes an apparatus comprising the flat substrate for use in the thermal cycling device. The invention is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of rice lesion formation inhibitor Sp17. The protein improves the heat stress of the plant, and can be used in the development of new breeds of plants for agriculture and horticulture. The present sequence is a PCR primer used to isolate the coding sequence of the invention
useful for medical diagnosis of diseases such as AIDS, also for amplification of nucleic acids in biological samples. The invention has the advantage that it enhances operatively as the heat resisting element is directly coupled to the microscopic slide, and reduces costs as the use of a heat sink is eliminated. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rice-originated gene, Sp17, that inhibits lesion formation and is applicable in improving heat stress of plants thus leading to prevention of lesion formation, for developing new breeds of plants for agriculture and horticulture.

The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol.

The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in careening for drugs and sweeteners. Recombinant call lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 gene, a sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymucleotide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes

```
The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour mestastasis, precancerous lession, theumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, osler-webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, incestinal adhesions, atherosclerosis, scleroderma and hyperirophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                            Anglogenesis inhibitor; ss; anglogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial anglogenesis; plaque meovascularisation; telangiectesia; haemophiliac joint; solgibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                     Angiogenesis inhibitory oligonucleotide #1019.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 2; Page 37; 276pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an antisense compound (I), 16 to 30 bases in length targeted to specific base regions of a nucleic acid encoding human Talin. Also described. (a) an antisense compound up to 30 bases in length which inhibits the expression of human Talin; (b) a composition (II) comprising (I) or (a), and (c) inhibiting the expression of human Talin in human cells or tissues comprising contacting the cells or tissues in vitro with (I) or (a). (I) has antimicrobial, antiinflammatory and cytostatic activities, and can be used in antiesness gene therapy and as a Talin expression inhibitor. (I) can be used: to prevent or delay infermantion or tumour formation, and in diagnostics, therapeutics, prophylaxis, and in research reagents and kits. The present sequence represents a human Talin antisense chimeric phosphorothicate colliquic lection, infinity wing 2' methoxyeftyl (2'-MOS) wings of 5 nucleotides at the 5' and 3' ends and a 10 nucleotide decoxy gap in the middle, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention relates to a set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19. The markers are useful for genotyping or estimating the frequency of an allele in a population, for detecting an association between a genotype or haplotype and a phenotype, e.g. a disease involving ersponses, obesity or disorders related to obesity, such as hypernicaemia, disease involving the responses, obesity pathology, hepatic function disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia, insulin disorders, atheromatous disease and cardiac insulficiency. The markers are useful for detecting a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker showlove. Sequences ABK41306-ABK41309 and ABK41328-ABK41331 represent Polymers used to amplify human LSR gene or USF2 gene biallelic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Set of novel map-related biallelic markers, preferably located on obesity disorder-associated chromosomal regions on chromosomes 3, 10 and 19, useful, for e.g. detecting statistical correlations between marker allele and a phenotype.
                                      Human, obesity associated-biallelic marker; as; LSR; USP2; PCR; primer; drug response, hyperuricaemia; digestive pathology; hypertension; cancer; hepatic function disorder; cardiovascular disease; hyperlipidaemia; insulin disorder; atheromatous disease; cardiac insufficiency; obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                               Cohen D, Blumenfeld M, Chumakov I, Abderrahim H, Bihain B;

ABQ93162 standard; DNA; 20 BP. (first entry) (revised) 29-AUG-2003 21-OCT-2002 ABQ93162; RESULT 1092 ABQ93162, 

T. tauschii/wheat D genome microsatellite cfd60 right PCR primer.

Microsatellite marker; wheat; D genome; mapping; genotyping; polymorphism; phenotypic trait; OTL; quantitative trait locus; disease-associated gene; development factor; quality factor; resistance factor; wheat product; identification; detection; genetically modified wheat; PCR; primer; ss.

```
The invention relates to a map of the bread wheat D genome comprising the genome location of a microsatellite marker selected from a group of 185 cuch markers (ABQ92733-ABQ9217). The invention also encompasses the use of left (ABQ921016 ABQ92107). The invention also encompasses the use of left (ABQ921016 ABQ92107). The invention also encompasses the use of left (ABQ921016 ABQ92107) primars to amplify and detect the microsatellie markers, and to identify genes responsible for a phenotypic trait of interest in wheat. Wheat is and allokazabloid species consisting of 3 diploid genomes designated A. B and conferent species. The D genome is thought to have been introduced in the most recent intercrossing, between the amphipolid AABB and Triticum taugchii (DD), probably involving only a limited number of genotypes of both species. Due to its polyploid genome, the large size of its genome, and its low level to polymerase slippage during replication. This high degree of between one and six nucleotides long, and are very polymorphic in lempth, mainly due to polymerase slippage during replication. This high degree of polymorphism makes them especiallite are codeminant, and exhibit kendedian independent of the companies. The succession of the propose of the invention are deficion, microsatellite markers thus help to overcome some of the propose second the microsatellite markers thus help to overcome some of the propose and the microsatellite markers thus help to overcome some of the propose and the microsatellite markers thus help to overcome some of the invention are useful for identifying genes and secondated primers of the invention are useful for identifying development factors, quality factors and factors conferring resistance to pathogens and xenobiotics. The markers and associated primers may be also be used for analysing genes and all allees implicated in the present comprises genetically modified when to assess whether or not a product comprises genetically modified where the presents a specifically older of prime
                                                                                                                                                                                                                                                                                                                                                      Map of wheat D genome comprising the genome location of a microsatellite marker, useful for e.g. identifying genes responsible for a desired phenotypic trait, especially quantitative trait loci in wheat, and

Example 2; Page 254; 391pp; English.

The present invention relates to the isolation of novel human proteins referred to as NOVX, and the polynucleotide sequences encoding them. The NOVX proteins of the invention include NOV1-NOV13. NOVX proteins, NOVX nucleic acids and antibodies are useful for treating or preventing a NOVX associated disorder, or alleviating a pathological state in a subject, particularly humans. Such disorders include cardiomyopathy, atherosclerosis, diabetes, cancer (e.g. adenocarcinoma, lymphoma, prostate cancer, uterus cancer; disorders related to cell signal processing and metabolic pathways, disorders of the neuro-olfactory system (e.g. those induced by trauma, surgery and/or neoplastic disorders), acquired immunodeficiency syndrome (ADS), inflammatory disorders (e.g. asthma) obseinty, anorexia, cancer-associated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's

The oligonucleotide of the invention specifically hybridises to and inhibits expression of caspase 6 in cells or tissues. The oligonucleotides can be administered therapeutically or prophylactically to treat an animal having a disease or condition associated with caspase 6, such as Rieger's syndrome or ataxia telangiectasia, hyperproliferative disorder, a haematopoietic disorder, a bone mecabolism or cholesterol disorder, various types of cancer, neurological conditions such as Alzheimer's disease and other deregulated apoptoric pathological conditions. This polynucleotide sequence represents a mouse caspase 6 oligonucleotide relating to the invention.

NOTE: This phosphorothioate oligonucleotide sequence has 2'-MOE wings and
disease), immune disorders, graft versus host disease, Crohn's disease, multiple sclerosis, haemophilia, idiopathic thrombocytopenic purpura, and infectious diseases (e.g. bacterial, fungal, protozoal or viral infections). The polymucleotide sequences are also useful in gene therapy. The present sequence represents a real time quantitative (RTQ)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Muscular, cytostatic; nootropic; neuroprotective; ophthalmological; antilipemenic; osteopathic; caepase 6; Rieger's syndrome; bone metabolism; ataxia telangiectasia; hyperproliferative disorder; cholesterol disorder; haematopoietic disorder; cancer; neurological; Alzheimer's disease;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant applied product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the maxfexer is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the maxed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified by using the above primer; (g) signals plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis, Abi42957 to Abi45322 represent per represent PCR primers for human chromosome 21q22.1, which are seprement for human chromosome 21q22.1, which are expresent represent present present invention in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; MEKK4 modulation; mitogen-activated protein kinase kinase 4; MTK1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new antisense compound, comprising 8-30 nucleobases targeted to a nucleic acid molecule encoding human cytohesin.

1, specifically hybridises with, and inhibits the expression of, human cytohesin.1, a guanine nucleotide exchange protein for ARF (ADF ribosylation factor). The antisense compound may be used in a pharmaceutical composition for inhibiting the expression of cytohesin.1 in human calls or tissues, and in treating a disease or condition associated with cytohesin.1 by administering to the human the antisense compound e.g. tumour or inflammation. The antisense compound e.g. tumour or inflammation. The antisense compound is also useful for diagnostics, therapeutics, prophylaxis and as research reagents and kiter. The present sequence is an antisense oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotide encoding human cytohesin-1, useful for preventing or treating a disease or condition associated with cytohesin-1 expression e.g. tumor or inflammation.
                                                                                                                                                                                                                                                                                                                                                             nn, antisense; cytohesin-1; guanine nucleotide exchange protein; ARF;

The present invention relates to antisense compounds, compositions and methods for modulating the expression of MEKK4 (also referred as mitogencrivated protein Kinase kinase 4; MAPSK4 MAP Phree Kinase 1; MAP/ERK kinase kinase 4; MAPKKK4; MTK1). The antisense oligos are useful for inhibiting the expression of MEKK4 in cells or tissues. They are also useful for treating an animal having a disease or condition associated with MEKK4 such as immunological, inflammatory, hyperproliferative disorder or cancer. Sequences of the invention are also useful for They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human MEKK4 DNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 20 BP; 4 A; 6 C; 5 G; 5 T; 0 U; 0 Other;

```
The present invention relates to a method of diagnosing a cellular proliferative disorder of breast tissue, which involves determining the state of methylation of one or more nucleic acids isolated from the subject, where the state of methylation of the nucleic acids as compared with a state of methylation from a subject not having the cellular proliferative disorder of breast tissue is indicative of a cellular proliferative disorder of breast tissue in the subject. The nucleic acids may be TWHST, HOXAS, NBS-1, retinoic acid receptor beta (RABDEta).

Costrogen receptor, cyclin D2, Wilms' tumour gene (WT-1), 14.3.3 sigma, HIN-1 or RASSFLA. The method is useful for diagnosing and/or determining a predisposition to a cellular proliferative disorder, in particular proliferative disorder, in particular carcinoma, colloid carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma, tubular carcinoma, medullary carcinoma, metaplastic carcinoma in situ. The present sequence is a primer used in the exemplification of the invention

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele by the promoter replacement fragment with a heterologous companies. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that cells in which both alleles and/or pathogenicity of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism, blosyntheric, transporter, transcriptional, transduction, DNA replication and cell division cativity. The method is useful for identifying a compound having the ability to inhibit growth or prolifezation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a pork primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

                                                                                                                                                                                                              à
                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an oversesible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are medified. The diploid fungal cells in which both alleles of a gene are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the compound catabolism, biosynthetic, transporter, transcriptional, transduction, DNA replication and cell division cativity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or therapeutic intervention, by inactivating in the strain one allele of gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                         Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

```
The invention relates to a nucleic acid encoding a adipose (ADP)
polypeptide which requlates, causes or contributes to obesity in an animal or a human. The polynucleotides, proteins, ant-adp antibodies, modulators of adp activity, adp antisense mucleic acids, expression vectors, adp transgenic animals are useful in the diagnosis and treatment of obesity, adiposites, bulimia, wasting (cachexia), eating disorders and/or disorders of body weight/body mass, weight loss due to cancer or infectious diseases, genetic disorders associated with hypogonadism e.g. prader-Willi syndrome, laurence-Moon-Biedl syndrome, hypothyroidism, diabetes, Cushing's syndrome, endocrine disorders, gastrointestinal diseases, inflammatory bowel disease, ulcerative colitis, and anorexia nervosa. They are also useful for treating disorders of body weight/mass creating ineart disease, and lipid storage diseases and for for treating conditions associated with under weight e.g. enhancing or controlling fertility, controlling weight loss in acquired immunodeficiency syndrome (AIDS) or cancer patients. The present sequence is a PCR primer used to amplify an adp nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Adipose protein; se; adp; obesity; transgenic animal; obesity; adipositas; bulimia; wasting; cachexia; eating disorder; blooder; 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel nucleic acid encoding adipose polypeptide which regulates, cause or contributes to obesity, useful for treating obesity, heart disease, hypertension, infertility, and controlling weight loss in cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Rothe M;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Dohrmann C, Haeder T,

The sequence represents a mouse syndecan-1 reverse transcription PCR primer. The invention relates to a novel use of a Smad3 inhibitor in preparing a medicament to treat or prevent wounds or fibrosis. The invention has antifibrotic and vulnerary activity. The Smad3 inhibitors are useful for preventing fibrosis and improving wound healing. The Smad3 protein, polypeptides and peptide fragments are useful for generating antibodies, as reagents for research purposes, or the identification of other cellular gene products involved in the regulation of fibrosis and improvement of wound healing, as reagents in assays for screening for of wound healing, and as pharmaceutical reagents in protecting against fibrosis and improving wound healing related to Smad3. Compounds that can be used in the prevention of fibrosis and improving wound healing related to Smad3. Compounds that fibrosis may be used in inhibiting the activity of wild type and/or mutant Smad3 gene products, in elaborating the biological function of Smad3, and in identifying compounds that disrupt normal Smad3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of Smad3 inhibitors in preparing a medicament for treating or preventing wounds or fibrosis, or as reagents in assays for screening compounds for preventing fibrosis and improving of wound healing.
                                                                                                                                                                                                 Smad3; wound healing; fibrosis; antifibrotic; vulnerary; mouse; PCR primer; reverse transcription; syndecan-1; ss.

The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferating cells with a therapeutically effective amount of an oligonucleotide of the invention. The method is useful for treating cancer, anglogenesis or neovascularisation, especially ocular anglogenesis or neovascularisation. The present DNA sequence is human raf

```
The invention relates to a novel antisense compound of 16-30 nucleotides targeted to any of 71 specified regions of the sequence that encodes human cytohesin-1 (CT1), where the compound hybridises and inhibits expression of human CT1. The compound of the invention has antiinflammatory, cytostatic, and anti-infective activity. The antisense compounds may have a use in antisense gene therapy. The antisense compounds are useful for treating or preventing disorders associated with expression of human CT1, e.g. infections, inflammation and tumours, and as research and diagnostic reagents. Sequences ABQ66412-ABQ6651 represent chimeric phosphorchioate oligonucleotides, with 2'-WOE wings and a deoxy gap. The claimed sequences inhibit production of cytohesin-1

The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents of a Salmonolla, listeria monocytogenes and Haemophilus influenza, fungal infectious agents and pollo virus, and parasitic infectious agents of papergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, papergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, selected from Ontoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 1 hydroxylase deficiency. Turner Syndrome and obesity defects.

CC detecting cancer involving oncogenes, tumour suppressor genes or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning electron microscope and infrared microscope) the support at the particular sites and identifying if ligation of the oligonucleotide sequences. Balba2014 to a presence or absence of the target micleotide sequences. Balba2014 to a balba2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, K-ras, PCR primer; probe; capture probe; mutation detection; ligase detection reaction; LDR; p53; BRCAL; BRCA2; infectious disease; infection; 21 hydroxylase deficiency; Turner Syndrome; obesity; cancer; oncogene; tumour suppressor; human papillomavirus; forenaic; environmental monitoring; food industry; feed industry; ss.

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise which little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epsterin-Barr virus and pollowirus, Entamoeba histolytica and Dracunculus selected from Onchoverva volvulus. Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency. Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes or genes involved in DNA amplification, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, psi gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning cancer as the administrated and correlating (using a computer) identified ligation to a presence or absence of the target nucleotide sequences. AB183074 to AB197546 represent oligonucleotide sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rat; rZAQ1; rZAQ2; G protein-coupled receptor; GPCR; antidiarrheic; laxative; drug development; digestive organ disease; colitis; diarrhoea; constipation; malabsorption syndrome; diagnosis; gene therapy;
                                                                                                                              Designing capture oligonucleotide probes for use on a support to which complementary oligonucleotides hybridize with little mismatch.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                 The present invention describes human and rat brain-originated G protein-
coupled receptor (GPCR) proteins. The GPCR sequences have antidiarrheic
and laxarive activities. The GPCR sequences can be used for developing
drugs to treat diseases of the digestive organs, e.g. colitis, diarrhoea,
constipation and malabsorption syndrome, including gene diagnosis and
therapy. The present sequence represents a PCR primer for rat GPCR, which
is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human, antisense; lung dysfunction; nasal airway dysfunction; antiallergic; antiallamatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel pharmaceutical composition, which has a
                                                                                                                 encoded DNAs, for developing drugs to treat diseases of the digestive organs, e.g. colitis, diarrhea, constipation and mal-absorption syndrome.
                                                                                                  and rat brain-originated G protein-coupled receptor proteins and

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an natifilammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, luck sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO at fig. wipo.int/pub/published_pot_sequences

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an initial ammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiathmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antishfammatory steroid in a subject, for reducing or depleting levels of antishfammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactent in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence date for this patent is not represented in the printed or specification, but was obtained in electronic format directly from WIPO ftp.wipo.int/pub/published\_pct\_sequences

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone

Claim 15; SEQ ID NO 992; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a

```
first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory seroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of adenosine receptor, producing bronchodoidation, increasing levels of adenosine receptor, producing bronchodoidation, increasing levels of adenosine receptor, producing bronchodoidation, increasing bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition.

The present invention relates to the isolation of a human retinal pigmented epithelium derived neurotrophic factor (FBDF), and polymucleotide sequences encoding it. The gene encoding human PEDF maps to chromosome 17p13.1-pter. The invention also describes a truncated version of PEDF referred to as PEDF-BH, vectors comprising nucleic acids encoding PEDF or PEDF-BH, and a method of using these sequences to treat retinal diseases such as retinal tumours (e.g. retinoblastoma), neuronal-retinal tumours, macular degeneration, retinitis pigmentosa, retinal detachment, diabetic retinopathy, inherited and age-related pathologies, tumours, coular diseases, nerve injuries, and conditions resulting from the activity of serine proteases. The present sequence represents a PCR primer used to isolate human PEDF genomic clones
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method (M) for generating a substantially homogeneous population of undifferentiated cells (UC) from a biological sample (BS), which comprises subjecting BS or its sub-sample to tissue-disruption to provide a mixed population (MP) comprising UC, subjecting MP to a cell size-discrimination (SP) step, and simultaneously or sequentially with SD, subjecting the cell population obtained to a cell-surface marker-discrimination step. prepared by (M); (2) a composition (II) for use in cell replacement therapy, comprising a population of substantially homogeneous population of neural stem cells (NSC9) generated by (M); and (3) a composition (III) comprising a growth factor identified using a homogeneous population (III) comprising a growth factor identified using a homogeneous population of NSC9 generated by (M). (I) can have nootropic, neuroprotective and antiparkinsonian activities, and can be used in gene therapy. (M) is useful for generating a substantially homogeneous population of undifferentiated cells such as NSC9 from a biological sample, and is useful for the replacement of neural or non-neural tissue in a naimal. (II) is useful in cell replacement therapy in an organ such as the brain or in the nervous system, preferably central nervous system (CNS), for treating a CNS disorder such as Alzheimer's disease, Parkinson's disease, centred brain injury and CNS dysfunction. (I) is useful for the repair or regeneration of tissue. Abz80278 to Abz80363 represent PCR primers which are used in an example from the present invention for markers defining

New antisense chimeric oligonucleotide, useful for modulating the expression of human Interleukin 12 p40 subunit, in treating or preventing disease states in humans and animals, and as research reagents and Example 15; Col 45; 42pp; English. diagnostics

The invention relates to an antisense compound 20-50 nucleobases in length targeted to a start codon region, coding region, a stop codon region of a nucleic acid molecule encoding human interleukin 12 p40 subunit. The compound specifically hybridises with one of the regions and inhibits the expression of human Interleukin 12 p40 subunit. The new compound is useful for inhibiting the expression of human Interleukin 12 p40 subunit in cells or tissues and comprises contacting the cells or tissues in vitro with the compound, so that antisense compound may also be used as research reagents and diagnostics, and as treatment or prevention of disease states, e.g. to prevent or delay infection, inflammation or tumour formation, in animals and humans. The present sequence is an antisense oligonucleotide of the invention

Novel antisense oligonucleotide which is targeted to mRNA encoding human raf and which is capable of inhibiting raf expression, useful for treating or preventing hyperproliferative conditions such as cancer.

```
The invention relates to an oligonucleotide 8-50 nucleotides in length which is targeted to mRNA encoding human c-raf, a-raf or b-raf (raf is a protein kinase playing a regulatory role in signal transduction, regulating cell proliferation and has been implicated in lung carcinoma), and which is capable of inhibiting raf expression. Also included is a composition comprising the oligonucleotide and a pharmaceutically a composition comprising the oligonucleotide and a pharmaceutically composition comprising the expression of human raf in human cells or tissues, by inhibiting the expression of human raf in human cells or tissues, by contacting the human cells or tissues with the oligo. The oligo. Is also is useful for treating or preventing a disease or condition associated with the expression of raf by administering it in combination with a checkherapeutic agent to a human or cells of the human, where the expression of raf is abnormal expression, and the condition is a hyperproliferative condition and as cancer, angiogenesis or neovascularisation. The oligo. is also useful for inhibiting hyperproliferation of cells. The oligos are also useful as tools, for example for detecting and determining the role of raf expression in hyperproliferation of cells. The oligos are also useful as tools, for example for detecting and determining the role of raf expression in carposes. The present sequence is an antisense oligonucleotide included in the sequence listing but not mentioned elsewhere in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Adenosine triphosphate (ATP)-binding cassette transporter subfamily C12; cystic fibrosis transmembrane conductance regulator; human; CFTR/MRP; multidrug resistance-like subgroup; somatic gene therapy; ABCC12; paroxysmal kinesigenic chorecathetosis; cysteinyl leukotriene; anionic drug; methotrexate; neutral drug; glutathione; glucuronate; sulphate conjugated drug; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New ATP-binding cassette transporter gene subfamily C12, ABCC12 polypeptide, useful for preventing or treating paroxysmal kinesigenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

This invention describes a novel human ABCC12 (adenosine triphosphate (ATP) binding cassette transporter gene subfamily C12, i.e. cystic fibrosis transmembrane conductance regulator/multidung resistance-like subgroup (CFTR/MEP) family) polypeptide and its encoding polymucleotides The polypeptide is useful for screening agonists and antagonist of the ABCC12 polypeptide. The products of the invention are useful for screening an active ingredient for preventing and treating paroxysmal screening an active ingredient for preventing and treating paroxysmal kinesper of organic anion transporters such as cystemyl leukotriene, anionic drugs, such as methotrexte, neutral drugs conjugated to acidic ligands, such as glucathione, glucuromate or suphate conjugated drugs and can be used for somatic gene therapy. This sequence represents a region corresponding to an exon/intron boundary from the gene encoding a human ABCC12 isoform described in the disclosure of the invention

New isolated gene 216 nucleic acids, useful for diagnosing, preventing or treating a disorder, such as asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease, obesity or inflammatory bowel

This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms

Example 10; Page 155; 650pp; English.

syndrome.

Example 10; Page 155; 650pp; English.

This invention relates to a novel isolated nucleic acid, gene 216,

identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anoxectic activities and may be used in gene therapy. The nucleotides of its fragments are useful for diagnosing, preventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pulmonary disease or adult respiratory distress syndrome), obeaity, or inflammatory bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific PCR primer used in the ö Human, mouse, 88; primer; gene 216; antiasthmatic; antiinflammatory; anorectic; chromosome 20p13-p12; single nucleotide polymorphism; SNP; gene therapy; respiratory disease; asthma; obesity; PCR; bronchial hyper-responsiveness; chronic obstructive pulmonary disease; adult respiratory distress syndrome; inflammatory bowel syndrome. growth factor receptor 3, useful for inhibiting the expression of receptor and for treating an animal having cancer or developmental disorder.

Example 15; Page 79; 120pp; English.

The invention relates to antisense compounds targetted to a nucleic acid molecule encoding fibroblast growth factor (FGF) receptor 3 (also known ser PGFR-3, ACH, JUX4 and CEK2) to inhibit its expression. Antisense compounds of the invention are useful for treating diseases or conditions associated with FGFR-3 such as developmental disorders or byperporiserative disorders, especially cancer of colorectal, bladder, bone, lung, cervical, breast or skin. They are useful as research reagents, therapeutice, prophylaxis, kits and diagnostics, and as tools in differential and/or combinatorial analyses to elucidate expression patterns of a portion of the genes expressed within cells and tissues. They are also useful in antisense therapy. The present sequence is an antisense oligonucleotide targetted to human FGFR-3

A method and a kit for determination of expression of mRNA or cDNA of protein participating in the maintenance of skin structure.

The present invention describes a method and a kit for determining the expression of mRNA or cDNA of a protein participating in the maintenance of skin structure. The method is quantitative, simple and accurate in the determination of extracellular matrix components of laminin 5 chain genes LAMA3, LAMB3 and LAMC2, matrix metalloproteinases MAP-1, MAP-2, MAP-3 and MAP-9, VII collagen, type I collagen alpha 1 chain, type IV collagen alpha 1 chain, ACF57290 represent PCR primers and probes used in the method of the

Semi-quantitative RT-PCR was used to determine levels of FADD RNA in thyroid trainsgenic mice during various stages of tumour development. These mice provide models of human. Hyroid tumours. FADD expression was shown to decrease, in some cases to zero, during tumour development. It therefore provides a marker for the absence of in vivo tumour. FADD proteins are secreted from tumour cells. A low cellular amount and a high extracellular amount of FADD proteins are prognostic of resistance to chemotherapy. The invention provides methods for determining a status of tumour to chemotherapy on the basis of prognosis.
                                                                                                                                                                                                                                                             FADD; mouse; tumour; marker; diagnosis; prognosis; thyroid; PCR; primer;

The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psortasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or frohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note= "Phosphorothioate backbone and all cytosines are methyl cytosines"
                                                                                                                                                                                                                                     Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.

The invention relates to a compound 8-50 nucleobases in length targeted to a nucleic acid molecule encoding complement component C3. The compound specifically hybridises with the nucleic acid molecule encoding component C3 or specifically hybridises with at least an 8-nucleobase component C3. Also included are a composition of complement component C3. Also included are a composition comprising the compound and a practice or alluent, inhibiting the expression of complement component C3 in cells or tissues (comprising contacting the component C3 or parties or alluent, inhibiting the expression of complement component C3 in cells or tissues (component C3 comprising contacting the component C3 comprising administering to the animal the component C3 component C3 in cells or tissues, or for treating an animal component C3 component C3 in cells or tissues, or for treating an animal having a component C3 in cells or tissues, or for treating an animal having a disease or condition associated with complement component C3 such as an utoimmune disorder (e.g. multiple sclerosis), an infection, or autoimmune disorder (e.g. multiple sclerosis), an infection, or alternation associated with complement component C3 cuch as an eather or component C6. The compound are also cuseful as research reagents and diagnostics, multiple organ failure, hyperacute organ failure and CNS inflammation. The compounds are also cuseful as research reagents and diagnostics, in distinguishing functions antisance of various members of a biological pathway, or for preventing or delaying an animal and consultance of an animal consultance of an animal consultance or an inflammation or tumour formation. The present sequence is an animal consultance or an animal consultance or an early an animal consultance or an early and animal consultance or an early and animal consultance or an early and animal component component can be consultanced by the component can be component can be consultanced by the component can be component can be consultanced by the compo

EIF2C1 is located on chromosome 1934-35, and is also known as Co-eIF2C, eIF2C, Golgi ER protein 95kDa, GER95 and 699. It is an intracellular membrane associated protein thought to be involved in cellular differentiation, such that altered expression of EIF2C1 can affect cell growth, morphology and tumourigenicity. Accordingly, antisense oligonucleotides that inhibit the expression of EIF2C1 in cells including hyperproliferative disorders, damilial hypercholesterolaemia and cancer, as well as polycystic kidney disease, cystic fibrosis and progeriod syndrome. As such, the oligos of the present invention can be described as having cytostatic and antilipaemic activities. This coligonucleotide sequence is an antisense oligo used to inhibit expression coligonucleotide sequence is an antisense oligo used to inhibit expression colification enterpression initiation factor 2C 1 (EIF2C1) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                           New compound, having a sequence targeted to a nucleic acid encoding human collapsin response mediator protein 2, useful for preparing a composition for treating hypercholesterolemia or hyperproliferative disorder, e.g.,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, ss; PCR; retinal pigment epithelial-derived neurotrophic factor; PEDF; tumour; ocular disease; neuronal cell pathology; serine protease; blood coagulation; thrombosis; bacterial infection; parasitic infection; elastosis; vascular disorder; fibrinoid formation; coagulation disorder; arteriosclerosis; ischaemia; arthroses diabetes; emphysema; arthritis;

The invention relates to a composition comprising purified retinal comprisions respirate and exived neurotrophic factor (PEDF). The PEDF proteins comprise ADB99089, ADB99080 are equivalent to but not identical to ADB99089. Human PEDF is encoded by ADB99088 Also included are purifying PEDF, producing PEDF comprising expressing the DNA sequence concoding the PEDF in a host cell, a recombinant DNA molecule comprising a certor comprising a PEDF nucleic acid molecule, an organism transformed vector comprising a PEDF nucleic acid molecule, an organism transformed to vector comprising a PEDF nucleic acid molecule, an organism transformed vector comprising the vector, a recombinant DNA molecule comprising a retinal PEDF CDNA, a host coll containing the vector, a recombinantly produced PEDF protein soluted or purified from a naturally occurring source organism and a purified human comprision and activation of promises in the protein soluted the protein of promises, i.e. retinal tumour, collar disease, neuronal cell pathologies, or conditions resulting from the activity of serine proteases, e.g. excessive or unwanted blood coagulation, thrombosis, bacterial infection, parasitic infection, alastosis, vacentical adisorders involving fibrinoid formation, coagulation disorders, arteriosclerosis, ischemmia, arthrices complement activation, ulcers, ulcerative colitis, pancreatitis, fibrinolytic disease, arthropathy, bone resorption, proteases, The present sequence is a PCR primer used to isolate genomic DNA encoding human retinal pigmented epithelium derived neurotrophic factor (PEDF).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New purified retinal pigmented epithelium derived neurotrophic factor composition, useful for treating tumors, i.e. retinal tumor, ocular disease, neuronal cell pathologies, coagulation disorders or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
septic shock; lung disease; complement activation; ulcer; ulcerative colitis; pancreatitis; psoriasis; fibrinolytic disease; arthropathy; bone resorption; hypertension; congestive heart failure; cirrhosis; protease allergy; chromosome 17p13.1-pter; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tombran-Tink J, Steele FR, Chader GJ, Becerra SP, Johnson LV;

The invention comprises antisense oligonucleotides that are targeted to the nucleic acid encoding transforming growth factor beta (TGF-beta) receptor II. The antisense oligonucleotides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence represents a 2'-O-methoxyethyl gapmer oligonucleotide with a phosphorothioate backbone that is targeted to human TGF-beta receptor II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New compound having a sequence targeted to a nucleic acid encoding Transforming growth factor beta-receptor II, useful for preparing a composition for treating hyperproliferative disorder e.g., lung, liver, colon or gastric cancer.
                                                                                                                                                            human; antisense oligonuclectide;

proteins (II) from Lollum perenne and Feetuca arundinacea which are active in lignin, fructan and tannin biosynthetic pathways. Also described (1) an isolated oligonucleotide probe or primer comprising at least 10 contiguous residues complementary to 10 contiguous residues of (1); (2) a kit comprising the oligonucleotide probe or primer; (3) a genetic construct comprising (1); (4) a transgenic plant cell comprising the genetic construct of (3); (5) a plant or its seed, fruit or progeny comprising the transgenic plant cell of (4); (6) modulating one or more of the lignin, fructan or tannin compositions; and (8) modifying the activity of (II) involved in a lignin, fructan or tannin compositions; tannin blosynthetic pathway in a plant. (1) can be used for modulating sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotide encoding polypeptides from Lolium perenne or Festuca arundinacea, useful for modulating the biosynthesis of lignin, fructan or tannin in a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR; Primer; 88; yeast; omega oxygenase complex; orytochrome PSG monoxygenase; CPP, NappH reductase enzymes; CPR; CPRA; CPRS,

WPI; 2003-765370/72.

New nucleic acid encoding cytochrome P450 and NADPH reductase enzymes (e.g. CPRA, CPRB or CYP52ALA), useful for producing dicarboxylic acids that may be utilized as industrial intermediates in manufacturing diesters and polymers.

Example 11; SEQ ID NO 47; 196pp; English

The invention relates to an isolated mucleic acid selected encoding candida tropicalis omega oxygenase complex enzymes (Cytcohrome P450 monooxygenase (CYPS and NADPH reductase enzymes (CPR) designated CPRA, checkers, CYPS2A18, CYPS2A28, CYPS2A28, CYPS2A38, CYPSA33, UNCAPA318, CYPSA33, UNCAPA318, CYPSA33, CYPSA333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333, CYPSA3333,

```
The invention relates to a compound (antisense oligomucleotide) hybridising with the eighth nucleobase portion of an active site on a nucleic acid molecule encoding CDB1 (also known as TARA-1, a tetraspania) and inhibiting the expression of CDB1. Also included is a composition comprising the antisense oligomucleotide and a carrier or a diluent. The antisense oligomucleotide is useful for inhibiting the expression of CDB1 in cells or tissues. The antisense oligomucleotide is useful for inhibiting the sxpression of CDB1 treating infections preferably viral, bacterial and parasitic and disease or condition is characterised by chemical dependency (e.g. cocaine addiction). The present sequence is a CDB1 antisense oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  "mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises oligonuclectides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonuclectides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonuclectide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detector for identifying human papilloma virus subtypes, comprises carrier having two parts carrying first and second oligonucleotides that respectively hybridize with DNA contained in first and second subtypes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

```
The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an HPV detection oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          angiogenesis inhibitor; cytostatic; antiinflammatory; cancer; ovarian disease; diabetic retinopathy; inflammatory; ZAQ; Bv8; I5E; 88; PCR; primer; RBv8-WR2.

                                            The invention relates to a novel angiogenesis inhibitor comprising a compound that inhibits the activity of an amino acid sequence given in the specification. Angiogenesis-related process BsNs, ZAQ and ISE were utilised within the method of the invention. The molecules of the invention demonstrate cytostatic and antiinflammatory activities whilst the method may be useful for treatment and prevention of cancer, ovarian diseases, diaberic retinopathy and inflammatory disease. The current sequence is that of the angiogenesis inhibitor-related PCR primer of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel method for investigating genetic infertility or predisposition in males. The method involves selecting at lleast two infertility-associated mutations which are recessive or intermediate that are associated with infertility in the heterozygous state and/or only in the homozygous state. Preferably at least one azoospermia factor is detected which may be lost by microdeletions intervals 5 or 6 of the Y-chromosome. Also any of several hundred mutations, listed, present in the cystic fibrosis transmembrane conductance regulator (CTFR), Kallmann syndrome (KAL1), androgen resistance (AR) or steroid 21-hydroxylase (CYP21) genes may be detected.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primer; male infertility; infertility-associated mutation; azoospermia factor; Y-chromosome; cystic fibrossis transmembrane conductance regulator; CTFR; Kallmann syndrome; KALl; androgen resistance; steroid 21-hydroxylase; CYP21; microarray; quantitative trait locus; in vitro fertilization;

probes for the mutated genes and/or native nucleic acid, or their complementary strands, are fixed to a carrier, particularly as a microarray, then tested for hybridization with oligomoulectides from or synthesized from, a patient sample and hybridization detected.

Multifactorial analysis is by standard statistical methods, particularly the quantitative trait loous method. The method is used to diagnose inherited male infertility or predisposition to its, especially in conjunction with in vitro fertilization programs, e.g. for assessing subjects with oligospermia for possible application of the intracytoplasmic sperm injection method. Analysis of many mutations inproves diagnosis of the genetic basis of male infertility, including polygonic origins (complex interactions between different heterozygotic mutations). A chip for analyzing genetic infertility, in males comprises oligonucleotides that represent known mutations (nonsense or missence, insertions, allelic variants deletions or rearrangements) in the cystic fibrosis transmembrane conductance regulator, Kallmann syndrogen resistance and steroid 21-hydroxylase genes. AdD42140-ADD42633 represent of the interestion, the microarray described in the method of the confine. NOTE: these area of SEQ ID's 133, 472 or 473 represented in the confine of the confine of the confidence and steroid 21-hydroxylase genes. SEQ ID list of the specification.

New isolated NOVX polypeptides and polynucleotides, useful for preventing, diagnosing or treating NOVX-associated disorders, e.g. osteoarthritis, obesity, atherosclerosis, cancer, Parkinson's disease, asthma, or infections.

Example C; SEQ ID NO 318; 447pp; English.

The invention relates to a novel isolated NOVX polypeptide. The polypeptide of the invention demonstrates, antidiabetic, anorectic, cardiant, hypotensive, antitarteriosolerotic, virucide, antiparkinsonian, indicide, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatory demanded, protozoacide, nootropic, neuroprotective, antiparkinsonian, anticonvulsant, osteopathic, antiarthritic, antiinflammatory for demanded, antibathmatic and antibodies may be useful for treating or diagnosing diseases including metabolic disorders such as diseases including metabolic disorders such as cardiovascular diseases including hypertension and atheroscierosis, neurodegenerative disorders such as Alzheimer's disease, Parkinson's cardiovascular diseases including hypertension and atheroscierosis, neurodegenerative disorders such as Alzheimer's disease, Parkinson's cardiovascular disorders, inflammatory sin disorders, asthma and dyslipidaemia.

Furthermore, the nucleic acids and polypeptides may also be used to identify molecules that modulate or inhibit neurogenesis, cell differentiation and proliferation, haemopolesis, wound healing and angiogenesis, as well as in gene therapy. Finally, the nucleic acids may be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The current sequence is that of interior and proliferation the exemplification of the invention

Cornett CA;

Madduri KM,

The invention relates to isolated mucleic acids encoding cytochrome P450 (CYP) and NADPH reductase (CPR) enzymes of the omega-hydroxylase complex of candida tropicalis. Also included are the CYP and CRR proteins of candida tropicalis. Also included are the CYP and CRP proteins of CYP52ASA, CYP52ASA, CYP52ASB, CYP52 PCR primer used in the analysis.

Sequence 20 BP; 7 A; 3 C; 9 G; 1 T; 0 U; 0 Other;

The invention relates to an isolated CPRA, CPRE, CYP52A1A, CYP52A2A, CYP52A2B, CYP52A4B, CYP52A4B, CYP52A4B, CYP52A4B, CYP52A4B, CYP52A4B, CYP52A4B, CYP5ABB or CYPCAPL CANDING PART reductase) of the condida tropicalis owega-hydroxylase complex. Also included are the nucleic aids encoding the CYP/CPR proteins (including their coding transformed with the vector, discriminating members of a gene family by quantifying the amount of target mRNA in a sample and increasing production of a dicarboxylic acid (comprising: providing a host cell having a naturally occurring CPR/CPP proceed and culturing the cost cell in media containing an organic substrate which upregulates the cens, to effect increased production of dicarboxylic acid). The CYP and CPR proteins, present in higher levels than normal is useful for increasing production of dicarboxylic acids. The present sequence is a cuntitative competitive reverse transcriptase PCR (QC-RT PCR) primer used to assay the levels of CYP/CPR mRNA in RNA samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated CPRA, CPRE, CYP52A1A, CYP52A2A, CYP52A2B, CYP52A3A, CYP52A3B, CYP52A5A, CYP52A5B, CYP52A5B, CYP52A5B, CYP52A6B, CYP52A6B, CYP52D4A protein, useful for increasing production of dicarboxylic acid in cells.

Protein contg. non-A non-B hepatitis antigen fragment - prepd. by culturing transformants transformed by vector contg. base sequence coding specified aminoacid sequences, used for detecting hepatitis.
                                                                            Hepatitis C virus antigen expressed as recombinant in E.coli - useful for diagnosis of hepatitis C virus infection.
                                                                                                                                                                The sequences given in AAQ27030-77 are primers. These were used to amplify the claimed hepatitis C virus genes of the invention which could then be inserted into an E. coli vector. The polypeptides encoded by the vectors were useful as diagnostic reagents for type C hepatitis and they may be produced efficiently by recombinant methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a primer for a DNA encoding a non-A non-B hepatitis virus (NANBH) or hepatitis C virus (HCV) antigen, useful for diagnosis or detection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The sequences given in AAT00282-394 represent DNA ligands to basic fibroblast growth factor (bFGF). These sequences were isolated using the primers and target regions given in AAG98421-29 using systematic primers and target regions given in AAG98421-29 using systematic containing a region of 30 or 40 random nucleotides flanked by constant sequence regions, were synthesized. The constant regions were designed to be amplified by the primers. The primer 3p7.1PS has 2 biotin phosphoramidites and two additional A residues covalently attached to its prophoramidites and two additional A residues covalently attached to its 5 terminus during synthesis. The randoms region was generated by utilising an equimolar mixture of the four nucleotides during oligonucleotide synthesis. Three pools of ssDNA were created that contain internal random regions. Each pool was incubated with bEGF at an excess of DNA to target. DNA bound to bEGF were selected by filtration. The selected single stranded DNA (ssDNA) was then amplified by PCR. A significant improvement in affinity of DNA ligands was seen after 10 tounds of selection. Five distinct families of ssDNA were identified, based on regions of homology. Some sequences showed no obvious homology to the five families and are considered to be orphans

```
The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT4608-T44693 are esp. used to detect HPV types 26, 31, 31B, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT4733-T4906, which are based on and amplify fragments of the L1, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prodes is done with probes derived from consensus sequences found in all characterised HPV derived from amplified products generated by L1 consensus primers. This sequence is a sense probe which has specificity for HPV6 and binds to the HPV genome at position 6813. (Updated on 25-MAR-2003 to correct PF
                                                  Nucleic acid hybridisation probes - specific for selected human papilloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligo:nucleotide probes for human papilloma-virus - used for detecting and typing HPV and for detecting previously unknown HPV types and subtypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Resnick
